Adjust Video Resolution and Frame Rate

April - 2020-01-30 - Basic Troubleshooting

**ADJUST VIDEO SETTINGS**

If you or another call participant are having audio and/or video quality issues, adjusting the video resolution may help.

1. Open the VSee Messenger app.

2. Click on the *gear icon* then *Video* tab. Select your best camera from the dropdown list.

3. If you are in a call, go to this same setting by clicking on *More > Settings > Audio and Camera Setup* on your video window.

**Audio and Camera Setup**

This is a shortcut to the Audio or Video tabs where you can choose your device from respective dropdown lists.

**Video Settings**

Set your video’s resolution, frame rate including its mirroring setup (optional).

- **Resolution** - Refers to the number of distinct pixels that could be displayed in each dimension. Choose between *Low, Medium, High (480p)* or *HD (720p)*. Recommended setting is *High (480p)* but lower it if you are having network and CPU usage issues.

- **Frame Rate** - This is the frequency (rate) at which consecutive images called frames appear on a display. Choose between *Low Bandwidth, Adaptive or 30fps*. Recommended setting is *Adaptive*.

- **Mirroring** - You have the option to flip your video image for hand-signing or when showing documents.

**Camera Settings** - Adjust your camera filter and proc amp settings (optional).

**RUN A GUIDED AUDIO/VIDEO CHECK**

Run it [here](#) and please follow the instructions.
